NASA OPEN DATA & EARTH OBSERVATION LINKS

Curated link directory for Earth Impact Intelligence
NASA Space Apps Challenge 2026 – Dancing with the SARs

This PDF includes all six resources shown in the supplied NASA Open Data slide, plus additional tools relevant to satellite and SAR data access. All URLs below are clickable.

1. Links from the NASA Open Data slide

1. NASA Open Data Portal

https://data.nasa.gov/

Catalog of publicly available NASA dataset records. Dataset files are often hosted in other NASA archives.

2. NASA API Portal

https://api.nasa.gov/

Directory of NASA APIs for imagery and scientific information. Check each API for authentication and rate limits.

3. NASA Earthdata Search

https://search.earthdata.nasa.gov/

Search Earth science observations by keyword, time and geographic area; useful for discovering satellite collections.

4. NASA Worldview

https://worldview.earthdata.nasa.gov/

Interactive visualization of satellite imagery and environmental events; useful for map context.

5. NASA Exoplanet Archive

https://exoplanetarchive.ipac.caltech.edu/

Catalog and programmatic access to exoplanets; not relevant to this project's Earth-observation use case.

6. NASA Open

https://www.nasa.gov/open/

NASA open innovation and open-science information.

2. Additional links for Earth Impact Intelligence

1. ASF Vertex

https://search.asf.alaska.edu/

Search and discover SAR scenes and products, including supported NISAR data.

2. ASF Search API documentation

https://docs.asf.alaska.edu/api/overview/

Programmatic discovery of SAR scenes and products.

3. NASA Earthdata Login

https://urs.earthdata.nasa.gov/

Create or manage an Earthdata account for data access that requires authentication.

4. NASA Global Imagery Browse Services (GIBS)

https://www.earthdata.nasa.gov/data/tools/gibs

NASA imagery services for web maps and GIS applications.

5. NASA EONET

https://eonet.gsfc.nasa.gov/

Earth Observatory Natural Event Tracker; curated natural-event metadata and related imagery links.

3. Recommended priorities

Priority	Platform	Project use
1	ASF Vertex + ASF Search API	Find NISAR/SAR scenes and automate scene discovery.
2	NASA Earthdata Search	Discover NASA Earth science collections and product metadata.
3	NASA Worldview + GIBS	Visual map context; check sensor, date and resolution of each layer.
4	NASA Open Data Portal	Find supporting dataset records and links to their host archives.
5	NASA API Portal	Use relevant APIs where they provide a needed service; not every API provides SAR imagery.

4. Practical notes

• NASA API keys apply to services that require them; check each API's current authentication rules and rate limits.

• Worldview and GIBS provide visualization services. Their layers are not necessarily SAR products and should not be treated as a substitute for NISAR analysis.

• For NISAR processing, use the relevant NISAR product documentation and SAR data-access workflows rather than assuming the general NASA API portal is the download API.

• Record dataset name, product level, acquisition date, processing version, spatial coverage, terms of use and source URL for every dataset.

• Do not publish sensitive civilian shelter locations or identifiable population concentrations in an active-conflict context.
